

APPLYING PRAZIPOND PLUS TO YOUR POND

Caution: The only accurate way to measure Prazi Pond Plus for dosing is by weight. Measuring Prazi Pond Plus, assuming a tablespoon is equivalent to 2.9 grams **is not accurate**. Due to settling of the product in shipping and when scooping it out of the jar, 1 tablespoon could contain as much as 7 or 8 grams of Prazi Pond Plus.

Only one treatment is needed and no water changes are required after the 7 day treatment period. During the 7 day treatment do not do any water changes. Water can be added to the pond during the treatment period as needed due to evaporation, etc. **Turn off UV lights for at least 4 days at start of treatment period.**

Dissolving Prazi in water: Prazi **does not** dissolve easily in water. There are various methods for applying Prazi to your pond. First of all please note that you do NOT need to achieve a 100% dissolving rate when mixing Prazi with water. Prazi will totally dissolve in your pond over a short period of time after application. When applying Prazi to your pond while it is only partially dissolved is not dangerous to your fish, even if they eat the Prazi flakes in the water. Prazi is **NOT** harmful to your biofilter. Prazi treatments are effective at **ANY** water temperature.

Methods for dissolving and applying Prazi Pond Plus:

Note: Prazi dissolves more easily in large volumes of water. **Below are 3 options for dosing:**

1. When dosing ponds 900 gallons or more in volume , dissolve Prazi in 3 LEVEL tablespoon increments per 900 gallons. Put no more than 3 LEVEL tablespoons of Prazi in a container that holds 1 to 2 quarts of water. Shake vigorously for 3 to 5 minutes. Very little of the Prazi will totally dissolve. **Put this mixture in a 5 gallon bucket with approximately 3 to 4 gallons of water (pond or tap water). Stir this mixture until you have achieved a 70% to 80% dissolved solution. Pour this mixture evenly around your pond or directly into the skimmer or filter inlet.**
2. When dosing ponds 900 gallons or more in volume , dissolve Prazi in 3 LEVEL tablespoon increments per 900 gallons. Put no more than 3 LEVEL tablespoons of Prazi in a container that holds 1 to 2 quarts of water. Shake vigorously for 3 to 5 minutes. Very little of the Prazi will totally dissolve. **Pour this mixture directly into the inlet leading to your pressurized bead filter, settling chamber, skimmer basket or any part of the plumbing system with adequate water flow.**
3. Prazi will dissolve readily in ProForm-C (malachite green & formalin treatment). A small amount of ProForm-C can be used to initially dissolve the Prazi for mixing with water. This method **should be used with caution** for ponds under 1,000 gallons. **Mix 3 tablespoons of Prazi with 1 ounce of ProForm-C. Shake well. Put this mixture in a 5 gallon bucket with approximately 3 to 4 gallons of water (pond or tap water). Stir well. This will treat 900 gallons. Pour this mixture evenly around your pond or directly into the skimmer.**
